UNITED STATES DISTRICT COURT
FOR THE WESTERN DISTRICT OF WASHINGTON

TRIUMPH IP LLC,

Plaintiff,

v.

SPORTS ART AMERICA, INC.,

Defendant.

Case No. 2:22-cv-1350

COMPLAINT FOR PATENT
INFRINGEMENT

DEMAND FOR JURY TRIAL

Plaintiff Triumph IP LLC files this Complaint for Patent Infringement against Sports Art America, Inc., and would respectfully show the Court as follows:

I. NATURE OF THE LAWSUIT

1. This is an action for patent infringement under the Patent Laws of the United States, Title 35 United States Code (“U.S.C.”) resulting from Sports Art America, Inc., infringing, in an illegal and unauthorized manner and without authorization and/or consent from Triumph IP LLC, United States Patent No. 7,177,291, pursuant to 35 U.S.C. §271, and to recover damages, attorney’s fees, and costs.

II. THE PARTIES

1. Plaintiff Triumph IP LLC (“Triumph” or “Plaintiff”) is a Texas limited liability company having an address at 1401 Lavaca Street, Suite 922, Austin, TX 78701.

2. On information and belief, Defendant Sports Art America, Inc., (“Defendant”) is a corporation organized and existing under the laws of Washington, with a registered agent MN Service Corporation (WA) at 2801 Alaskan Way, STE 300, Seattle, WA 98121.

1 **III. JURISDICTION AND VENUE**

2 3. This action arises under the patent laws of the United States, Title 35 of the United
3 States Code. This Court has subject matter jurisdiction of such action under 28 U.S.C. §§ 1331
4 and 1338(a).

5
6 4. On information and belief, Defendant is subject to this Court’s specific and
7 general personal jurisdiction, pursuant to due process and the Washington Long-Arm Statute,
8 due at least to its business in this forum, including at least a portion of the infringements alleged
9 herein. Furthermore, Defendant is subject to this Court’s specific and general personal
10 jurisdiction because Defendant is a Washington corporation.

11 5. Without limitation, on information and belief, within this State and this District,
12 Defendant has used the patented inventions thereby committing, and continuing to commit, acts
13 of patent infringement alleged herein. In addition, on information and belief, Defendant has
14 derived revenues from its infringing acts occurring within Washington and the Western District
15 of Washington. Further, on information and belief, Defendant is subject to the Court’s general
16 jurisdiction, including from regularly doing or soliciting business, engaging in other persistent
17 courses of conduct, and deriving substantial revenue from goods and services provided to persons
18 or entities in Washington and the Western District of Washington. Further, on information and
19 belief, Defendant is subject to the Court’s personal jurisdiction at least due to its sale of products
20 and/or services within Washington and the Western District of Washington. Defendant has
21 committed such purposeful acts and/or transactions in Washington and the Western District of
22 Washington such that it reasonably should know and expect that it could be haled into this Court
23 as a consequence of such activity.

24
25
26 6. Venue is proper in this district under 28 U.S.C. § 1400(b). On information and
27 belief, Defendant is incorporated in Washington, and it has a place of business within this
28

1 District. On information and belief, from and within this District Defendant has committed at
2 least a portion of the infringements at issue in this case.

3 7. For these reasons, personal jurisdiction exists and venue is proper in this Court
4 under 28 U.S.C. § 1400(b).
5

6 **IV. COUNT I**
(PATENT INFRINGEMENT OF UNITED STATES PATENT NO. 7,177,291)

7 8. Plaintiff incorporates the above paragraphs herein by reference.

8 9. On February 13, 2007, United States Patent No. 7,177,291 (“the ‘291 Patent”)
9 was duly and legally issued by the United States Patent and Trademark Office. The ‘291 Patent
10 is titled “Method for Associating an Apparatus in a Communication Network.” The term of the
11 ‘291 patent has been adjusted by 1,126 days. A true and correct copy of the ‘291 Patent is
12 attached hereto as Exhibit A and incorporated herein by reference.
13

14 10. Triumph is the assignee of all right, title, and interest in the ‘291 patent, including
15 all rights to enforce and prosecute actions for infringement and to collect damages for all relevant
16 times against infringers of the ‘291 Patent. Accordingly, Triumph possesses the exclusive right
17 and standing to prosecute the present action for infringement of the ‘291 Patent by Defendant.
18

19 11. The invention in the ‘291 Patent relates to the field of associating an apparatus to
20 a communication network capable of sharing the same transmission frequency resources as
21 another neighboring network. (Ex. A at col. 1:9-12). The inventor’s recognized inefficiencies of
22 the prior art when the collision of the frames originating from two networks contacting the same
23 apparatus and developed an improved method. (*Id.* at col. 1:38-40).
24

25 12. Local networks using sharing of the radio resource in Frequency Division
26 Multiple Access (“FDMA”) mode are required to use one channel from among a finite set of
27 channels, which is given and granted by the standardizing bodies. (*Id.* at col. 1:19-22). To avoid
28

1 mutual disturbance, it is oven advisable to implement techniques for probing various channels.
2 (*Id.* at col. 1:23-24). Equipment wishing to create a wireless network will listen to channels and
3 choose a channel which it deems to be free of any radio activity, using a dynamic frequency
4 selection (“DFS”) mechanism. (*Id.* at col. 1:26-30). However, when there are multiple local
5 networks, it is possible that two networks, though geographically close, may have chosen the
6 same frequency, without interfering with one another. (*Id.* at col. 1:31-34). This is all the more
7 probable the lower the number of channels dedicated to this service. (*Id.* at col. 1:34-35). It may
8 be the case where an apparatus which has to associate itself with a network may also be able to
9 communicate with a base station of another network, causing the problem of the collision of
10 frames originating from the two networks at the level of the apparatus. (*Id.* at col. 1:36-40).

11
12
13 13. The inventors recognized that they could reduce the collision of frames in a
14 communications network when associating an apparatus to a first communication network by
15 performing the steps of detecting by the apparatus a first transmission channel, determining a
16 collision on the channel between signals originating from the first network and from a second
17 network; in case of collision, transmitting a change of channel request to the first network, and
18 associating the apparatus with a base station of the first network following non-detection of a
19 collision. (*Id.* at col. 4:41-53).

20
21 14. **Direct Infringement.** Upon information and belief, Defendant has been directly
22 infringing at least claim 1 of the ‘291 patent in Washington, and elsewhere in the United States,
23 by performing actions comprising at least performing the claimed process for associating an
24 apparatus to a first communication network with transmissions in the first network being
25 performed on a first channel using the SportsArt C574U-13 (“Accused Instrumentality”) (*e.g.*,
26 https://www.gosportsart.com/wp-content/uploads/documentation/C574U-13_Sell_ENG.pdf).

1 15. The Accused Instrumentality practices a process for associating an apparatus (*e.g.*,
 2 the Accused Instrumentality) to a first communication network (*e.g.*, Wi-Fi network of an access
 3 point), with transmissions in the first network being performed on a first channel (*e.g.*, a
 4 communication channel). The Accused Instrumentality supports IEEE 802.11n standard and gets
 5 associated with an access point according to the standard.

9

10 C574U-13 UPRIGHT CYCLE

11 The SENZA™ Elite line encompasses our quality cardio
 12 products, integrated with premium technology and
 13 entertainment options that actively engages users by
 14 providing an intuitive workout experience that allows them
 to consume their entertainment, their way. The C574U-13
 Upright Cycle features a low-profile shroud design for ease-
 of-access, vertically and horizontally adjustable seat, fingertip
 resistance controls, and an integrated 13-inch SENZA™ display.

15

16 KEY FEATURES

- 13-inch SENZA™ touchscreen
- Horizontal and vertical seat adjustment
- Contact HR sensors

17

Connectivity	Wi-fi (IEEE 802.11 a/b/g/n) LAN Ethernet (10/100Mbps)
---------------------	---

18

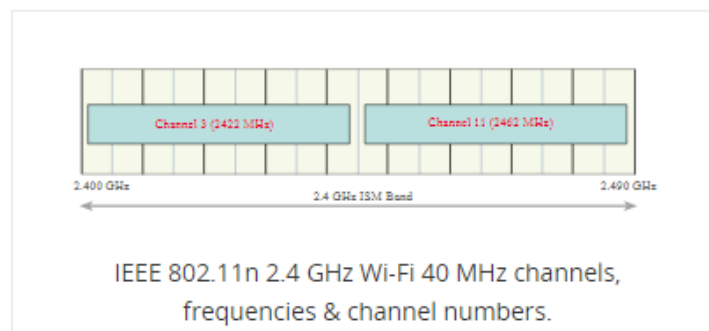

19 (*E.g.*, [https://www.gosportsart.com/wp-content/uploads/documentation/C574U-](https://www.gosportsart.com/wp-content/uploads/documentation/C574U-13_Sell_ENG.pdf)
 20 [13_Sell_ENG.pdf](https://www.gosportsart.com/wp-content/uploads/documentation/C574U-13_Sell_ENG.pdf)).

1 The IEEE 802.11 HT STA provides physical layer (PHY) and medium access control (MAC) features that
 2 can support a throughput of 100 Mb/s and greater, as measured at the MAC data service access point (SAP).
 3 An HT STA supports HT features as identified in Clause 9 and Clause 20. An HT STA operating in the
 4 5 GHz band supports transmission and reception of frames that are compliant with mandatory PHY
 5 specifications as defined in Clause 17. An HT STA operating in the 2.4 GHz band supports transmission and
 6 reception of frames that are compliant with mandatory PHY specifications as defined in Clause 18 and
 7 Clause 19. An HT STA is also a quality of service (QoS) STA. The HT features are available to HT STAs
 8 associated with an HT access point (AP) in a basic service set (BSS). A subset of the HT features is available
 9 for use between two HT STAs that are members of the same independent basic service set (IBSS).

10 An HT STA has PHY features consisting of the modulation and coding scheme (MCS) set described in
 11 20.3.5 and physical layer convergence procedure (PLCP) protocol data unit (PPDU) formats described in
 12 20.1.4. Some PHY features that distinguish an HT STA from a non-HT STA are referred to as multiple input,
 13 multiple output (MIMO) operation; spatial multiplexing (SM); spatial mapping (including transmit
 14 beamforming); space-time block coding (STBC); low-density parity check (LDPC) encoding; and antenna
 15 selection (ASEL). The allowed PPDUs may be transmitted with 20 MHz or 40 MHz bandwidth.

16 (E.g., https://standards.ieee.org/standard/802_11n-2009.html).

17 With the use of IEEE 802.11n, there is the possibility of using signal bandwidths of either 20
 18 MHz or 40 MHz. When 40 MHz bandwidth is used to gain the higher data throughput, this
 19 obviously reduces the number of channels that can be used.

20 (E.g., [https://www.electronics-notes.com/articles/connectivity/wifi-ieee-802-11/channels-](https://www.electronics-notes.com/articles/connectivity/wifi-ieee-802-11/channels-frequencies-bands-bandwidth.php)
 21 [frequencies-bands-bandwidth.php](https://www.electronics-notes.com/articles/connectivity/wifi-ieee-802-11/channels-frequencies-bands-bandwidth.php)).

1 **11.14.2 Basic 20/40 MHz BSS functionality**

2 An HT AP declares its channel width capability (20 MHz only or 20/40 MHz) in the Supported Channel
3 Width Set subfield of the HT Capabilities element.

4 An HT AP shall set the STA Channel Width field to 1 in frames in which it has set the Secondary Channel
5 Offset field to SCA or SCB. An HT AP shall set the STA Channel Width field to 0 in frames in which it has
6 set the Secondary Channel Offset field to SCN.

7 A non-AP HT STA declares its channel width capability (non-FC HT STA or FC HT STA) in the Supported
8 Channel Width Set subfield in the HT Capabilities element.

9 If the AP or IDO STA starts a 20/40 MHz BSS in the 5 GHz band and the BSS occupies the same two
10 channels as any existing 20/40 MHz BSSs, then the AP or IDO STA shall ensure that the primary channel of

11 the new BSS is identical to the primary channel of the existing 20/40 MHz BSSs and that the secondary
12 channel of the new 20/40 MHz BSS is identical to the secondary channel of the existing 20/40 MHz BSSs,
13 unless the AP discovers that on these two channels are existing 20/40 MHz BSSs with different primary and
14 secondary channels.

15 (*E.g.*, https://standards.ieee.org/standard/802_11n-2009.html).

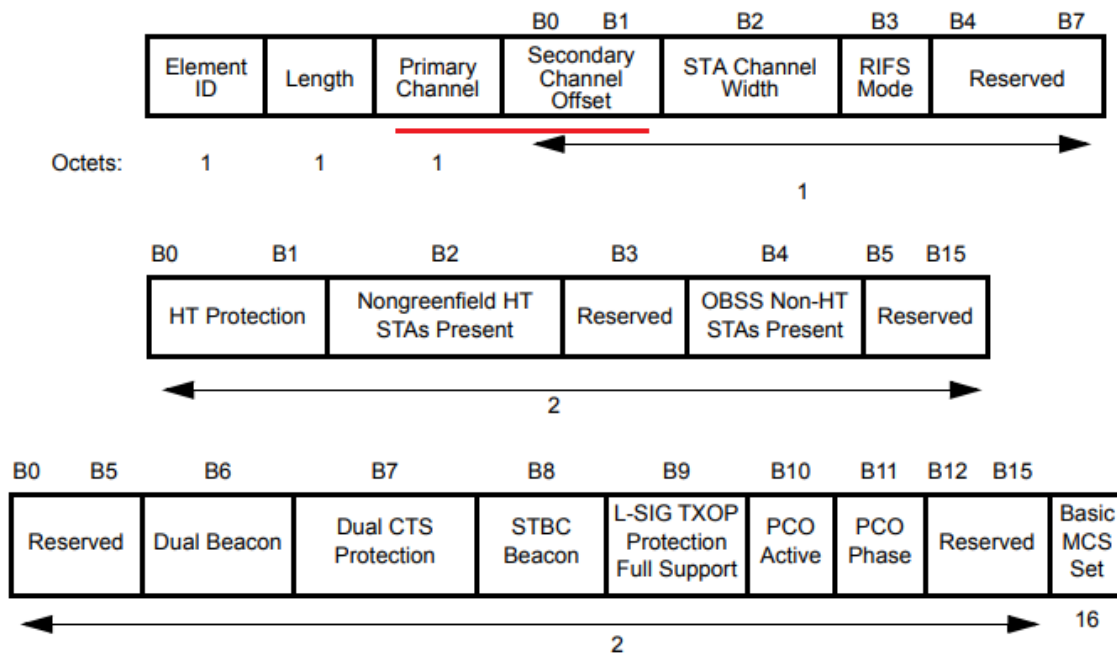

16 16. Upon information and belief, the Accused Instrumentality practices detecting by
17 said apparatus (*e.g.*, the Accused Instrumentality) of the first transmission channel (*e.g.*, a
18 communication channel). The Accused Instrumentality supports IEEE 802.11n standard. It gets
19 associated with an access point according to the standard. It receives a high throughput operation
20 element from the access point and determines a primary and secondary channel pair for data
21 transmission with the access point.
22
23
24
25
26
27
28

1 The IEEE 802.11 HT STA provides physical layer (PHY) and medium access control (MAC) features that
 2 can support a throughput of 100 Mb/s and greater, as measured at the MAC data service access point (SAP).
 3 An HT STA supports HT features as identified in Clause 9 and Clause 20. An HT STA operating in the
 4 5 GHz band supports transmission and reception of frames that are compliant with mandatory PHY
 5 specifications as defined in Clause 17. An HT STA operating in the 2.4 GHz band supports transmission and
 6 reception of frames that are compliant with mandatory PHY specifications as defined in Clause 18 and
 7 Clause 19. An HT STA is also a quality of service (QoS) STA. The HT features are available to HT STAs
 8 associated with an HT access point (AP) in a basic service set (BSS). A subset of the HT features is available
 9 for use between two HT STAs that are members of the same independent basic service set (IBSS).

10 An HT STA has PHY features consisting of the modulation and coding scheme (MCS) set described in
 11 20.3.5 and physical layer convergence procedure (PLCP) protocol data unit (PPDU) formats described in
 12 20.1.4. Some PHY features that distinguish an HT STA from a non-HT STA are referred to as multiple input,
 13 multiple output (MIMO) operation; spatial multiplexing (SM); spatial mapping (including transmit
 14 beamforming); space-time block coding (STBC); low-density parity check (LDPC) encoding; and antenna
 15 selection (ASEL). The allowed PPDU formats are non-HT format, HT-mixed format, and HT-greenfield
 16 format. The PPDUs may be transmitted with 20 MHz or 40 MHz bandwidth.

17 (E.g., https://standards.ieee.org/standard/802_11n-2009.html).

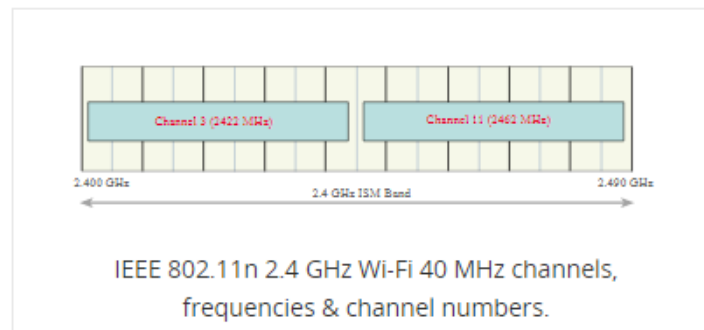

18 The operation of HT STAs in the BSS is controlled by the HT Operation element. The structure of this
 19 element is defined in Figure 7-95o24.

Field	Definition	Encoding	Reserved in IBSS ?
Primary Channel	Indicates the channel number of the primary channel. See 11.14.2.	Channel number of the primary channel	N
Secondary Channel Offset	Indicates the offset of the secondary channel relative to the primary channel.	Set to 1 (SCA) if the secondary channel is above the primary channel Set to 3 (SCB) if the secondary channel is below the primary channel Set to 0 (SCN) if no secondary channel is present The value 2 is reserved	N

(E.g., https://standards.ieee.org/standard/802_11n-2009.html).

With the use of IEEE 802.11n, there is the possibility of using signal bandwidths of either 20 MHz or 40 MHz. When 40 MHz bandwidth is used to gain the higher data throughput, this obviously reduces the number of channels that can be used.

(E.g., <https://www.electronics-notes.com/articles/connectivity/wifi-ieee-802-11/channels-frequencies-bands-bandwidth.php>).

11.14.2 Basic 20/40 MHz BSS functionality

An HT AP declares its channel width capability (20 MHz only or 20/40 MHz) in the Supported Channel Width Set subfield of the HT Capabilities element.

An HT AP shall set the STA Channel Width field to 1 in frames in which it has set the Secondary Channel Offset field to SCA or SCB. An HT AP shall set the STA Channel Width field to 0 in frames in which it has set the Secondary Channel Offset field to SCN.

A non-AP HT STA declares its channel width capability (non-FC HT STA or FC HT STA) in the Supported Channel Width Set subfield in the HT Capabilities element.

(E.g., https://standards.ieee.org/standard/802_11n-2009.html).

1 If the AP or IDO STA starts a 20/40 MHz BSS in the 5 GHz band and the BSS occupies the same two
2 channels as any existing 20/40 MHz BSSs, then the AP or IDO STA shall ensure that the primary channel of
3 the new BSS is identical to the primary channel of the existing 20/40 MHz BSSs and that the secondary
4 channel of the new 20/40 MHz BSS is identical to the secondary channel of the existing 20/40 MHz BSSs,
5 unless the AP discovers that on these two channels are existing 20/40 MHz BSSs with different primary and
6 secondary channels.

(E.g., https://standards.ieee.org/standard/802_11n-2009.html).

7 17. Upon information and belief, the Accused Instrumentality practices determining
8 of a collision on said channel between signals originating from the first network (e.g., Wi-Fi
9 network of an access point) and from a second network (e.g., another Wi-Fi network of nearby
10 access point, radar, etc.). The Accused Instrumentality determines a utilization of the primary or
11 secondary channel (i.e., collision on a channel) by another Wi-Fi network, radar system, etc.

13 **11.14.2 Basic 20/40 MHz BSS functionality**

14 An HT AP declares its channel width capability (20 MHz only or 20/40 MHz) in the Supported Channel
15 Width Set subfield of the HT Capabilities element.

16 An HT AP shall set the STA Channel Width field to 1 in frames in which it has set the Secondary Channel
17 Offset field to SCA or SCB. An HT AP shall set the STA Channel Width field to 0 in frames in which it has
18 set the Secondary Channel Offset field to SCN.

19 A non-AP HT STA declares its channel width capability (non-FC HT STA or FC HT STA) in the Supported
20 Channel Width Set subfield in the HT Capabilities element.

21 If the AP or IDO STA starts a 20/40 MHz BSS in the 5 GHz band and the BSS occupies the same two
22 channels as any existing 20/40 MHz BSSs, then the AP or IDO STA shall ensure that the primary channel of
23 the new BSS is identical to the primary channel of the existing 20/40 MHz BSSs and that the secondary
24 channel of the new 20/40 MHz BSS is identical to the secondary channel of the existing 20/40 MHz BSSs,
25 unless the AP discovers that on these two channels are existing 20/40 MHz BSSs with different primary and
26 secondary channels.

(E.g., https://standards.ieee.org/standard/802_11n-2009.html).

1 While operating a 20/40 MHz BSS, an IDO STA or an AP may decide to move its BSS, and an AP may
2 decide to switch the BSS to 20 MHz operation either alone or in combination with a channel move. These
3 channel move or BSS width switch operations can occur if, for example, another BSS starts to operate in
4 either or both of the primary or secondary channels, or if radar is detected in either or both of the primary or
5 secondary channels, or for other reasons that are beyond the scope of this standard. Specifically, the AP or
6 IDO STA may move its BSS to a different pair of channels, and the AP may separately, or in combination
with the channel switch, change from a 20/40 MHz BSS to a 20 MHz BSS using either the primary channel
of the previous channel pair or any other available 20 MHz channel. While operating a 20 MHz BSS, an
IDO STA or an AP may decide to move its BSS, and an AP may decide to switch the BSS to a 20/40 MHz
BSS, either alone or in combination with a channel move.

7 (E.g., https://standards.ieee.org/standard/802_11n-2009.html).

8 Radio regulations may require RLANs operating in the 5 GHz band to implement a mechanism to avoid co-
9 channel operation with radar systems and to ensure uniform utilization of available channels. The DFS
service is used to satisfy these regulatory requirements.

10 The DFS service provides for the following:

- 11 — Association of STAs with an AP in a BSS based on the STAs' supported channels.
- 12 — Quieting the current channel so it can be tested for the presence of radar with less interference from
13 other STAs.
- 13 — Testing channels for radar before using a channel and while operating in a channel.
- 14 — Discontinuing operations after detecting radar in the current channel to avoid interference with
15 radar.
- 15 — Detecting radar in the current and other channels based on regulatory requirements.
- 16 — Requesting and reporting of measurements in the current and other channels.
- 17 — Selecting and advertising a new channel to assist the migration of a BSS or IBSS after radar is
18 detected.

18 (E.g., https://standards.ieee.org/standard/802_11-2007.html).

19 The requirements described in this subclause apply only when an HT STA is operating in a regulatory class
20 for which the behavior limits set listed in Annex J includes the value 16; i.e., the regulatory class is subject
21 to DFS with 50–100 μs radar pulses.

22 For an HT STA, the following MIB attributes shall be set to TRUE: dot11RegulatoryClassesImplemented,
dot11RegulatoryClassesRequired, and dot11ExtendedChannelSwitchEnabled.

23 An AP operating a 20/40 MHz BSS, on detecting an OBSS whose primary channel is the AP's secondary
24 channel, switches to 20 MHz BSS operation and may subsequently move to a different channel or pair of
25 channels. An IBSS DFS owner (IDO) STA operating a 20/40 MHz IBSS, on detecting an OBSS whose
primary channel is the IDO STA's secondary channel, may choose to move to a different pair of channels.

26 (E.g., https://standards.ieee.org/standard/802_11n-2009.html).

1 18. Upon information and belief, the Accused Instrumentality practices such that
2 when said collision has been determined, transmitting a change of channel (*e.g.*, another
3 communication channel) request to the first network (*e.g.*, Wi-Fi network of an access point).
4 The Accused Instrumentality sends a request to switch channel on detection of utilization of the
5 primary or secondary channel (*i.e.*, collision on a channel) by another Wi-Fi network, radar
6 system, etc.

8 **11.14.2 Basic 20/40 MHz BSS functionality**

9 An HT AP declares its channel width capability (20 MHz only or 20/40 MHz) in the Supported Channel
10 Width Set subfield of the HT Capabilities element.

11 An HT AP shall set the STA Channel Width field to 1 in frames in which it has set the Secondary Channel
12 Offset field to SCA or SCB. An HT AP shall set the STA Channel Width field to 0 in frames in which it has
set the Secondary Channel Offset field to SCN.

13 A non-AP HT STA declares its channel width capability (non-FC HT STA or FC HT STA) in the Supported
14 Channel Width Set subfield in the HT Capabilities element.

15 If the AP or IDO STA starts a 20/40 MHz BSS in the 5 GHz band and the BSS occupies the same two
16 channels as any existing 20/40 MHz BSSs, then the AP or IDO STA shall ensure that the primary channel of

17 the new BSS is identical to the primary channel of the existing 20/40 MHz BSSs and that the secondary
18 channel of the new 20/40 MHz BSS is identical to the secondary channel of the existing 20/40 MHz BSSs,
19 unless the AP discovers that on these two channels are existing 20/40 MHz BSSs with different primary and
20 secondary channels.

21 While operating a 20/40 MHz BSS, an IDO STA or an AP may decide to move its BSS, and an AP may
22 decide to switch the BSS to 20 MHz operation either alone or in combination with a channel move. These
23 channel move or BSS width switch operations can occur if, for example, another BSS starts to operate in
24 either or both of the primary or secondary channels, or if radar is detected in either or both of the primary or
25 secondary channels, or for other reasons that are beyond the scope of this standard. Specifically, the AP or
26 IDO STA may move its BSS to a different pair of channels, and the AP may separately, or in combination
27 with the channel switch, change from a 20/40 MHz BSS to a 20 MHz BSS using either the primary channel
28 of the previous channel pair or any other available 20 MHz channel. While operating a 20 MHz BSS, an
IDO STA or an AP may decide to move its BSS, and an AP may decide to switch the BSS to a 20/40 MHz
BSS, either alone or in combination with a channel move.

(*E.g.*, https://standards.ieee.org/standard/802_11n-2009.html).

1 Radio regulations may require RLANs operating in the 5 GHz band to implement a mechanism to avoid co-
2 channel operation with radar systems and to ensure uniform utilization of available channels. The DFS
3 service is used to satisfy these regulatory requirements.

4 The DFS service provides for the following:

- 5 — Association of STAs with an AP in a BSS based on the STAs' supported channels.
- 6 — Quieting the current channel so it can be tested for the presence of radar with less interference from
7 other STAs.
- 8 — Testing channels for radar before using a channel and while operating in a channel.
- 9 — Discontinuing operations after detecting radar in the current channel to avoid interference with
10 radar.
- 11 — Detecting radar in the current and other channels based on regulatory requirements.
- 12 — Requesting and reporting of measurements in the current and other channels.
- 13 — Selecting and advertising a new channel to assist the migration of a BSS or IBSS after radar is
14 detected.

15 (E.g., https://standards.ieee.org/standard/802_11-2007.html).

16 The requirements described in this subclause apply only when an HT STA is operating in a regulatory class
17 for which the behavior limits set listed in Annex J includes the value 16; i.e., the regulatory class is subject
18 to DFS with 50–100 μ s radar pulses.

19 For an HT STA, the following MIB attributes shall be set to TRUE: dot11RegulatoryClassesImplemented,
20 dot11RegulatoryClassesRequired, and dot11ExtendedChannelSwitchEnabled.

21 An AP operating a 20/40 MHz BSS, on detecting an OBSS whose primary channel is the AP's secondary
22 channel, switches to 20 MHz BSS operation and may subsequently move to a different channel or pair of
23 channels. An IBSS DFS owner (IDO) STA operating a 20/40 MHz IBSS, on detecting an OBSS whose
24 primary channel is the IDO STA's secondary channel, may choose to move to a different pair of channels.

25 (E.g., https://standards.ieee.org/standard/802_11n-2009.html).

1 **10.3.15.1 MLME-CHANNELSWITCH.request**

2 **10.3.15.1.2 Semantics of the service primitive**

3 *Change the parameter list in 10.3.15.1.2 follows:*

4 The primitive parameters are as follows:

```

5         MLME-CHANNELSWITCH.request(
6             Mode,
7             Channel Number,
8             Secondary Channel Offset,
9             Channel Switch Count,
10            VendorSpecificInfo
11        )
    
```

9 *Insert the following row before the Channel Switch Count row in the untitled table defining the primitive parameters in 10.3.15.1.2:*

Name	Type	Valid range	Description
Secondary Channel Offset	Integer	As in Table 7-27a	Specifies the position of secondary channel in relation to the primary channel. The parameter shall be present if the MIB attribute dot11FortyMHzOperationImplemented is TRUE; otherwise, the parameter shall not be present.

15 (E.g., https://standards.ieee.org/standard/802_11n-2009.html).

17 19. Upon information and belief, the Accused Instrumentality practices associating
 18 the apparatus with a base station (e.g., an access point) of the first network (e.g., Wi-Fi network
 19 of an access point), following non-detection of collision.

1 **11.14.2 Basic 20/40 MHz BSS functionality**

2 An HT AP declares its channel width capability (20 MHz only or 20/40 MHz) in the Supported Channel
3 Width Set subfield of the HT Capabilities element.

4 An HT AP shall set the STA Channel Width field to 1 in frames in which it has set the Secondary Channel
5 Offset field to SCA or SCB. An HT AP shall set the STA Channel Width field to 0 in frames in which it has
6 set the Secondary Channel Offset field to SCN.

7 A non-AP HT STA declares its channel width capability (non-FC HT STA or FC HT STA) in the Supported
8 Channel Width Set subfield in the HT Capabilities element.

9 If the AP or IDO STA starts a 20/40 MHz BSS in the 5 GHz band and the BSS occupies the same two
10 channels as any existing 20/40 MHz BSSs, then the AP or IDO STA shall ensure that the primary channel of

11 the new BSS is identical to the primary channel of the existing 20/40 MHz BSSs and that the secondary
12 channel of the new 20/40 MHz BSS is identical to the secondary channel of the existing 20/40 MHz BSSs,
13 unless the AP discovers that on these two channels are existing 20/40 MHz BSSs with different primary and
14 secondary channels.

15 While operating a 20/40 MHz BSS, an IDO STA or an AP may decide to move its BSS, and an AP may
16 decide to switch the BSS to 20 MHz operation either alone or in combination with a channel move. These
17 channel move or BSS width switch operations can occur if, for example, another BSS starts to operate in
18 either or both of the primary or secondary channels, or if radar is detected in either or both of the primary or
19 secondary channels, or for other reasons that are beyond the scope of this standard. Specifically, the AP or
20 IDO STA may move its BSS to a different pair of channels, and the AP may separately, or in combination
21 with the channel switch, change from a 20/40 MHz BSS to a 20 MHz BSS using either the primary channel
22 of the previous channel pair or any other available 20 MHz channel. While operating a 20 MHz BSS, an
23 IDO STA or an AP may decide to move its BSS, and an AP may decide to switch the BSS to a 20/40 MHz
24 BSS, either alone or in combination with a channel move.

25 (E.g., https://standards.ieee.org/standard/802_11n-2009.html).

1 Radio regulations may require RLANs operating in the 5 GHz band to implement a mechanism to avoid co-
2 channel operation with radar systems and to ensure uniform utilization of available channels. The DFS
3 service is used to satisfy these regulatory requirements.

4 The DFS service provides for the following:

- 5 — Association of STAs with an AP in a BSS based on the STAs' supported channels.
- 6 — Quieting the current channel so it can be tested for the presence of radar with less interference from
7 other STAs.
- 8 — Testing channels for radar before using a channel and while operating in a channel.
- 9 — Discontinuing operations after detecting radar in the current channel to avoid interference with
10 radar.
- 11 — Detecting radar in the current and other channels based on regulatory requirements.
- 12 — Requesting and reporting of measurements in the current and other channels.
- 13 — Selecting and advertising a new channel to assist the migration of a BSS or IBSS after radar is
14 detected.

15 (E.g., https://standards.ieee.org/standard/802_11-2007.html).

16 The requirements described in this subclause apply only when an HT STA is operating in a regulatory class
17 for which the behavior limits set listed in Annex J includes the value 16; i.e., the regulatory class is subject
18 to DFS with 50–100 μs radar pulses.

19 For an HT STA, the following MIB attributes shall be set to TRUE: dot11RegulatoryClassesImplemented,
20 dot11RegulatoryClassesRequired, and dot11ExtendedChannelSwitchEnabled.

21 An AP operating a 20/40 MHz BSS, on detecting an OBSS whose primary channel is the AP's secondary
22 channel, switches to 20 MHz BSS operation and may subsequently move to a different channel or pair of
23 channels. An IBSS DFS owner (IDO) STA operating a 20/40 MHz IBSS, on detecting an OBSS whose
24 primary channel is the IDO STA's secondary channel, may choose to move to a different pair of channels.

25 (E.g., https://standards.ieee.org/standard/802_11n-2009.html).

26 20. Plaintiff has been damaged as a result of Defendant's infringing conduct.

27 Defendant is thus liable to Plaintiff for damages in an amount that adequately compensates
28 Plaintiff for such Defendant's infringement of the '291 Patent, *i.e.*, in an amount that by law
cannot be less than would constitute a reasonable royalty for the use of the patented technology,
together with interest and costs as fixed by this Court under 35 U.S.C. § 284.

29 21. On information and belief, Defendant has had at least constructive notice of the
'291 Patent, by operation of law and marking requirements have been complied with.

JURY DEMAND

Plaintiff, under Rule 38 of the Federal Rules of Civil Procedure, requests a trial by jury of any issues so triable by right.

V. PRAYER FOR RELIEF

WHEREFORE, Plaintiff respectfully requests that the Court find in its favor and against Defendant, and that the Court grant Plaintiff the following relief:

- a. Judgment that one or more claims of United States Patent No. 7,177,291 have been infringed, either literally and/or under the doctrine of equivalents, by Defendant;
- b. Judgment that Defendant account for and pay to Plaintiff all damages to and costs incurred by Plaintiff because of Defendant’s infringing activities and other conduct complained of herein;
- c. That Plaintiff be granted pre-judgment and post-judgment interest on the damages caused by Defendant’s infringing activities and other conduct complained of herein;
- d. That Plaintiff be granted such other and further relief as the Court may deem just and proper under the circumstances.
